

Report Builder rebuild

Owner-review evidence package

Branch: codex/report-builder-rebuild

Base implementation commit: f654bac

Scope: local implementation and verification only

Completed in this pass

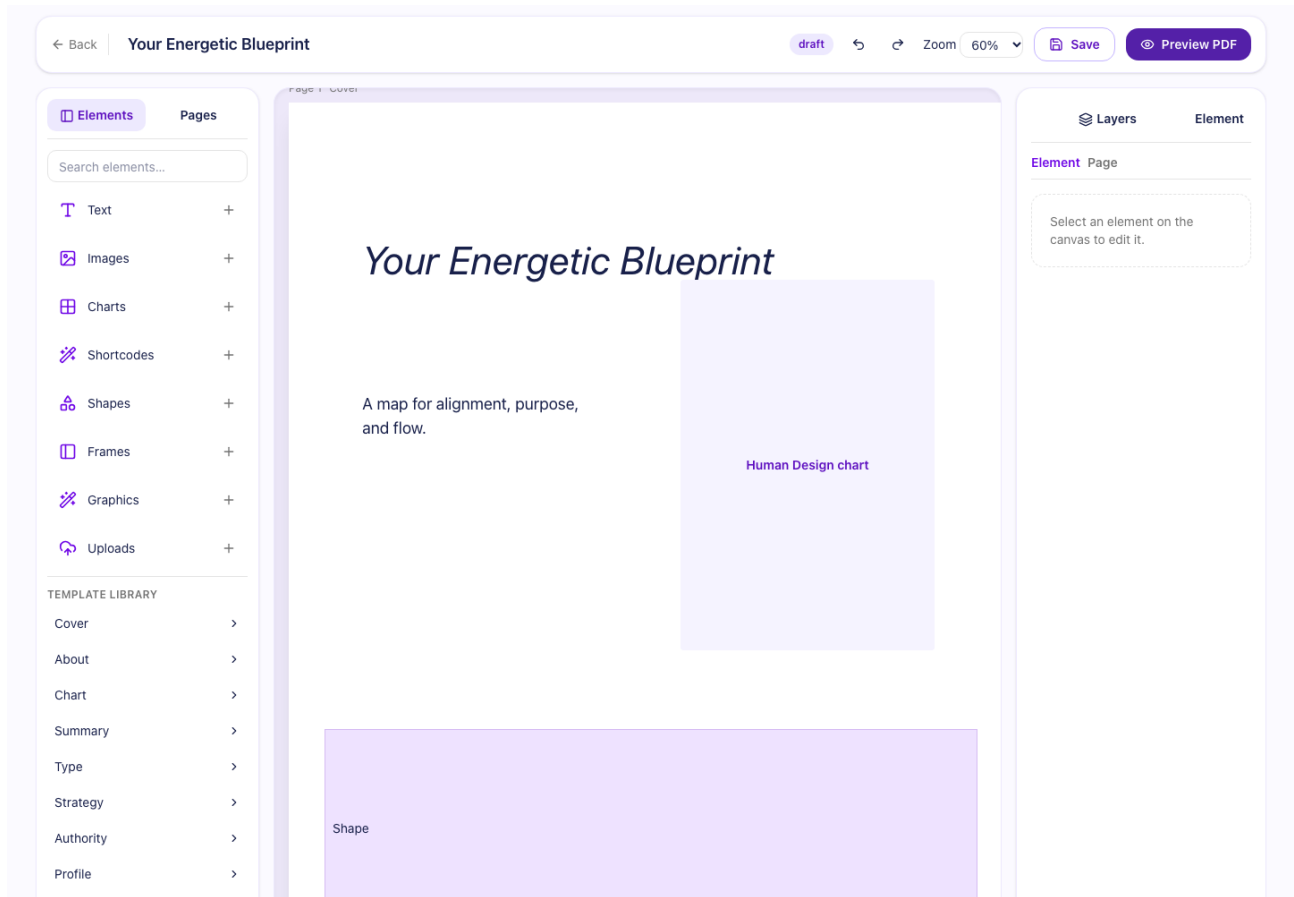

- Content Set selection is carried through preview and Generate Report.
- Strict custom-set resolution keeps missing fields blank and reports missing content before generation.
- Structured interpretation content is supported across HD, Astrology, and Frequency inputs.
- Canvas chart elements use the existing real chart renderers; image elements select Media Library assets.
- Generated-report snapshots carry the selected Content Set and page geometry metadata for PDF parity.

Verification

TypeScript: passed. Production build: passed. Content Sets suite: 33 checks passed using the documented server-only shim. Existing repository lint warnings remain non-blocking; no deployment or production data access was used.

Desktop editor evidence

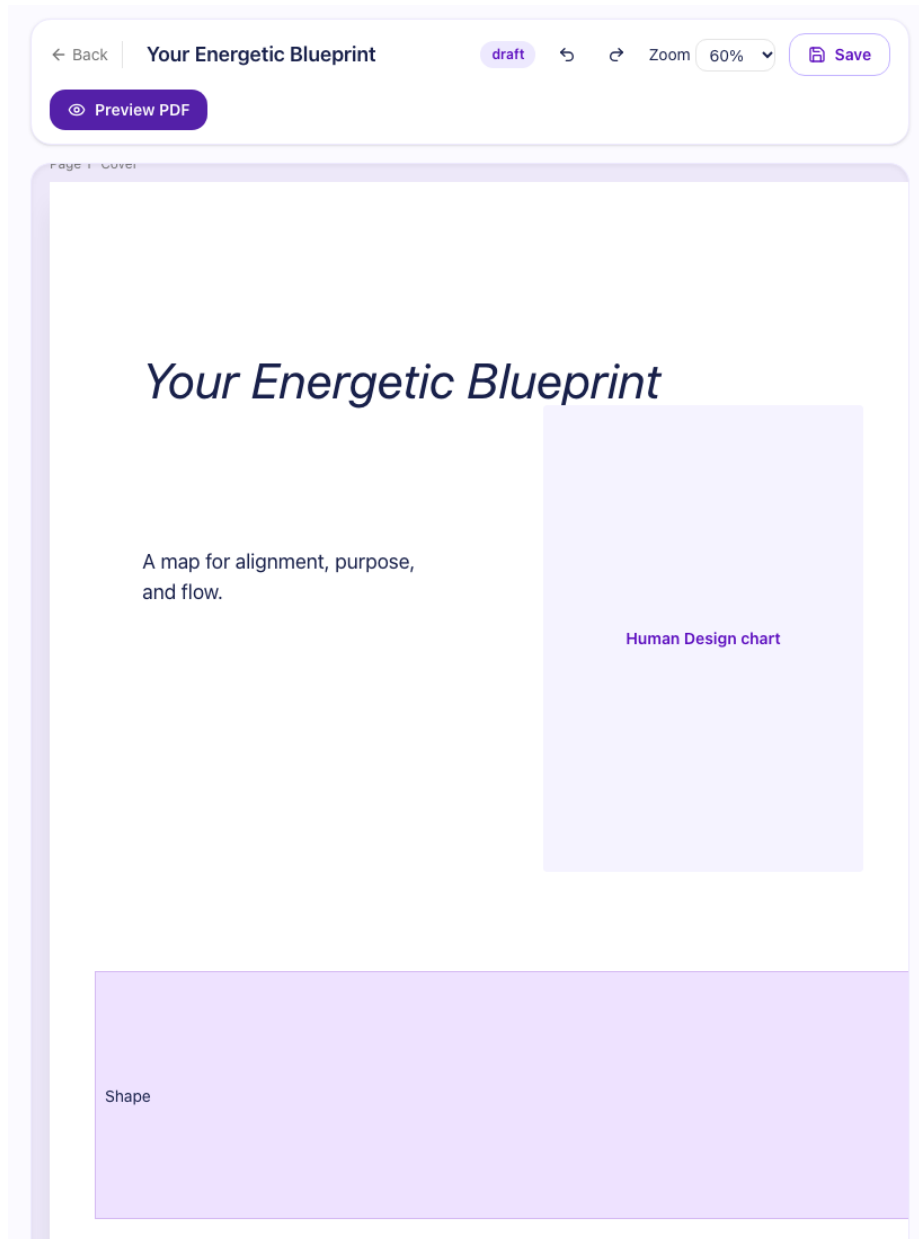

The local editor renders the three-pane composition surface with independently scrollable tools, canvas, and inspector regions.

1440px evidence from the local review harness. The canvas is a real saved-design surface; chart and image tools are connected to the delivery model rather than placeholder-only output.

Responsive evidence

The editor reorganizes to a sequential flow at tablet and phone widths while preserving Save, Preview PDF, and the inspector controls.

Delivery and snapshot behavior

Preview uses the current unsaved design draft and selected Content Set. Generate Report checks missing interpretation content, offers Continue anyway without filling blanks, and freezes the selected set and resolved text in the generated snapshot. Legacy block pages remain supported alongside the new canvas representation.

Check	Result
Content Set selection	Preview and generation paths carry the selected set
Missing content	Non-blocking warning; Continue anyway preserves blanks
Charts	HD, Mandala, Astrology, Frequency use existing renderers
Images	Media Library picker stores selected asset URL/id
PDF geometry	Letter/A4/custom metadata carried into renderer
Safety	No push, deploy, production writes, or Build Log update

Artifact note

This package is evidence for local review of the rebuild branch. Authentication-backed runtime data was not available in the local environment, so no claim is made that this artifact is production verification.
